

Ellipsoidal dished ends

DIN

28 013

Gewölbte Böden; Korbformen

Supersedes May 1987 edition.

In keeping with current practice in standards published by the International Organization for Standardization (ISO), a comma has been used throughout as the decimal marker.

Dimensions in mm

1 Scope and field of application

This standard specifies dimensions and technical delivery conditions for one-piece ellipsoidal dished ends ('ends', for short). It applies to ellipsoidal dished ends with or without weld that have an outside diameter, d_a , of up to 4000 mm and a wall thickness, s , of up to 50 mm. It covers ends of dimensions satisfying the following conditions:

$$r_1 = 0,8 d_a$$

$$r_2 = 0,154 d_a$$

$$h_1 \geq 3 s^1)$$

$$h_2 = 0,255 d_a - 0,635 s$$

This standard may apply by analogy to ends in larger sizes. Particularly for ends made of segments, tolerances should be subject to agreement.

For torospherical dished ends, see DIN 28 011.

The wall thickness may be designed, for example, on the basis of the *Technische Regeln Druckbehälter* (Codes of practice for pressure vessels) or the *Technische Regeln Dampfkessel* (Codes of practice for steam boilers).

2 Dimensions and designation

2.1 Dimensions

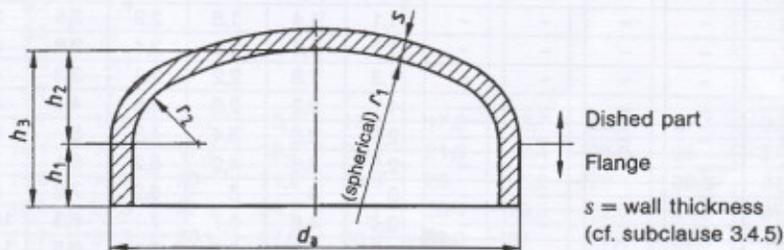

Figure 1: Ellipsoidal end

The volume and surface area of ends (disregarding h_1) shall satisfy the following conditions:

volume of dished part, $V \approx 0,1298 (d_a - 2 s)^3$;

external surface area of dished part, $A_a \approx 1,08 d_a^2$;

internal surface area of dished part, $A_i \approx 1,08 (d_a - 2 s)^2$.

The datum line is defined by the height, h_1 , as specified in table 1. When ordering, it may be agreed that this line be marked on the dished end.

For 1), see page 2.

Continued on pages 2 to 11.

● Series 1 pipe, outside diameter as in DIN 2448.

1) The flange height shall not be less than 3 s. It need not, however, exceed the following dimensions.

Wall thickness	Flange height
s ≤ 50	150
50 < s ≤ 80	120
80 < s ≤ 100	100
100 < s ≤ 120	75
120 < s ≤	50

Any other flange heights shall be subject to agreement.

2) See subclause 3.4.5.

3) For d_a greater than 4000 mm, the other dimensions, volume and surface area shall be calculated in line with clauses 1 and 2.

For 4), see page 3.

For ⁴⁾, see page 3.

2.2 Flange edges

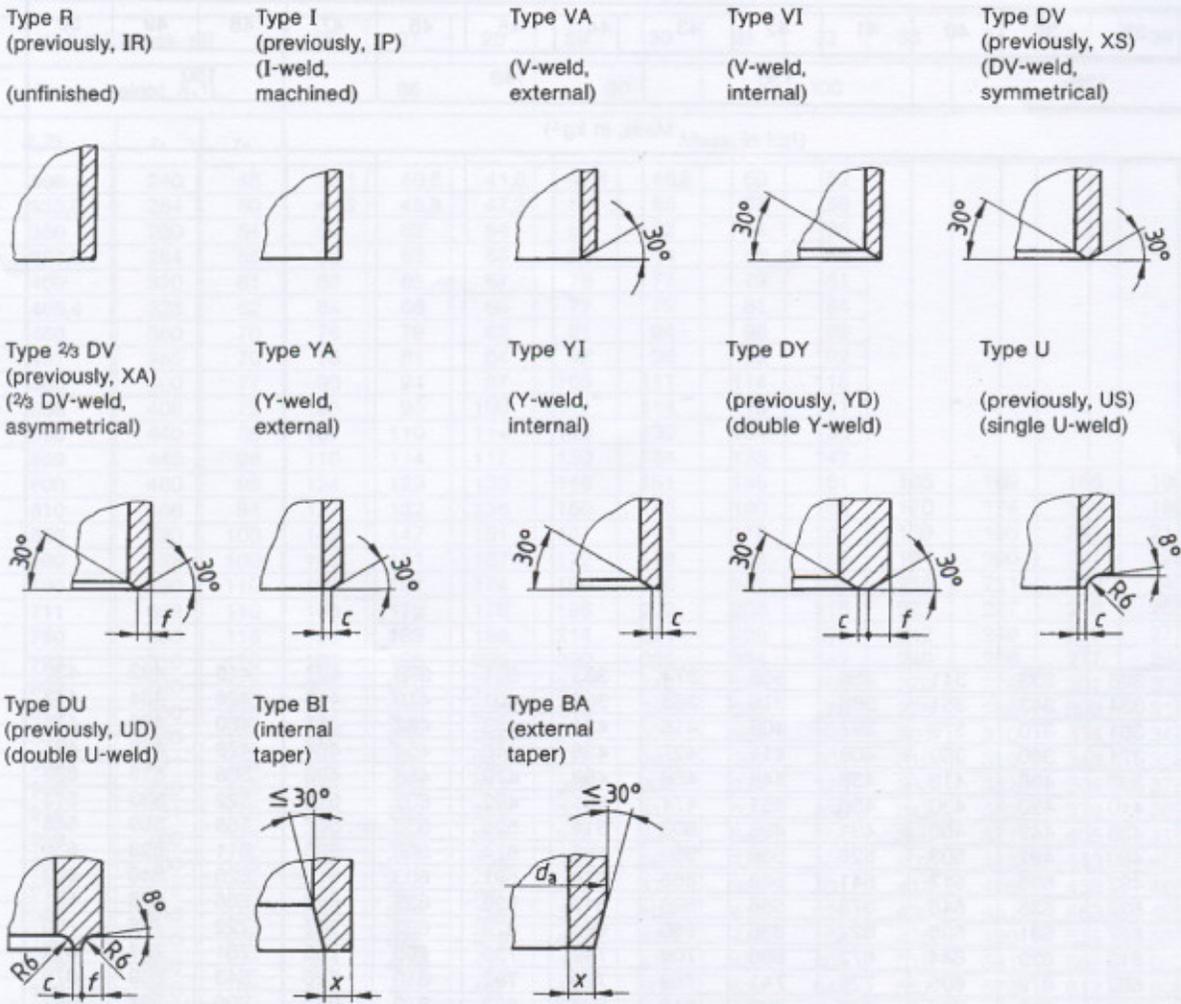

Figure 2: Flange edges

The flange edges shall be made by machining or by flame cutting. Dimensions c , f and x shall be agreed at the time of ordering, as should the angles and radii if they deviate from those shown in figure 2. Any other type of weld shall be subject to agreement, based on drawings, at the time of ordering.

2.3 Designation

Designation of an ellipsoidal dished end made of HII steel as in DIN 17 155, with an outside diameter, d_a , of 600 mm and a wall thickness, s , of 20 mm, with type VA flange edge:

Dished end DIN 28013 – 600 × 20 – VA – HII

Designation of an ellipsoidal dished end made of HII steel as in DIN 17 155, with an outside diameter, d_a , of 600 mm and a minimum wall thickness, s_{min} , of 19,5 mm, with type VA/type BI flange edge tapered inside with $x = 15$ mm:

Dished end DIN 28013 – 600 × 19,5 MIN – VA BI – 15 HII

3 Technical delivery conditions

3.1 Materials

Subject to agreement, the ends shall be made of one of the following materials:

- a) hot rolled unalloyed structural steel as in DIN EN 10 025;
 - b) steel sheet and strip with elevated temperature properties as in DIN 17 155;
 - c) stainless steel as in DIN 17 440 or in *Stahl-Eisen-Werkstoffblatt* (Iron and steel materials sheet) 400;
 - d) fine grained structural steel suitable for welding as in DIN 17 102;
 - e) low-temperature steel;
 - f) clad steel;
 - g) high-temperature and heat resisting steels;
- } as in DIN Standards, *AD-Merkblätter*, *VdTÜV-Werkstoffblätter* (VdTÜV Materials sheets) or *Stahl-Eisen-Werkstoffblätter*.

- h) special alloys; } as in DIN Standards, *AD-Merkblätter*, *VdTÜV-Werkstoffblätter*
 i) nonferrous metals; } (*VdTÜV Materials sheets*) or
 } *Stahl-Eisen-Werkstoffblätter*.
 j) materials as in other national and international specifications.

3.2 Manufacture and heat treatment

Ends may either be cold or hot formed, unless a specific type of forming has been explicitly agreed. Heat treatment shall be subject to agreement (e.g. as specified in the *AD-Merkblätter* of series HP 7). If an end has been put together from a number of parts (either before or after forming), this shall be stated by the manufacturer.

3.3 Surface finish

Ends shall be supplied with untreated surfaces. Any specific finish (e.g. descaled, pickled, blasted) shall be subject to agreement.

3.4 Limit deviations

3.4.1 Limit deviations for height h_3

The limit deviations for height $h_3 = h_1 + h_2$ shall be $+0,015 d_a$ or $+10$ mm (whichever is higher) and 0.

These deviations are valid for ends with machined flange edges. Ends with unfinished flange edges (type R) shall be designed so that they can be used to manufacture other types specified in this standard.

3.4.2 Limit deviations for circumference

The limit deviations for the circumference shall be as specified in table 2.

Table 2

Material	Outside diameter, d_a	Limit deviations for circumference
Hot rolled unalloyed structural steel, high-temperature steel, low-temperature steel (ferritic, untempered), fine grained structural steel	$d_a < 100$	± 3 mm
	$100 \leq d_a < 300$	± 4 mm
	$300 \leq d_a < 1000$	$\pm 0,4$ %
	$1000 \leq d_a \leq 4000$	$\pm 0,3$ %
Stainless steel, high alloy steel, low-temperature steel (austenitic or quenched and tempered), austenitic clad steel	$d_a < 100$	± 3 mm
	$100 \leq d_a < 300$	± 5 mm
	$300 \leq d_a \leq 4000$	+ 0,5 % - 0,7 %
Clad steel (other than austenitic clad steel), nonferrous metals	$d_a < 100$	± 3 mm
	$100 \leq d_a < 300$	± 5 mm
	$300 \leq d_a \leq 4000$	± 1 %

3.4.3 Out-of-roundness

The out-of-roundness, $u = \frac{2(d_{a \max} - d_{a \min})}{(d_{a \max} + d_{a \min})} \cdot 100$ % shall not exceed 1 %.

The largest difference in diameter, $d_{a \max} - d_{a \min}$, for d_a up to 4000 mm shall not be greater than 30 mm.

3.4.4 Closer tolerances

Where required, closer tolerances for the circumference or out-of-roundness may be agreed.

If ends are to be used in pairs or as inner or outer ends, the limit deviations shall be subject to agreement.

3.4.5 Limit deviations for wall thickness

If the order states the nominal wall thickness only, the actual wall thickness may deviate by the values specified in table 3.

Table 3

Wall thickness	Permissible lower deviation
Up to 10	-0,3
Above 10 up to 30	-0,5
Above 30 up to 50	-0,8
Above 50	-1,0,

If the order requests a minimum wall thickness, the actual wall thickness shall not be smaller. In such cases, instead of referring to the wall thickness, s , the flange height, h_1 , shall refer to the minimum wall thickness, s_{min} . (h_1 is equal to the value of s_{min} without decimal fraction.)

In order to ensure adequate or minimum thickness, the thickness of the sheet used for the manufacture shall include an allowance.

A larger wall thickness is permitted, particularly in the flange area (compression). If tapering of the edges is requested, it shall be stated in the order (type BI or BA, as in subclause 2.2.).

3.5 Determining the circumference

3.5.1 Point of measurement

In the case of ends with machined flange edges, the circumference shall be measured along the edge.

In the case of ends with unfinished edges, the circumference shall be measured in the zone defined by the upper and lower limit deviation for h_3 as specified in subclause 3.4.1.

3.5.2 Determining the external circumference

The circumference shall be measured at the point specified in subclause 3.5.1, using a gauged measuring tape as in DIN 6403. When calculating the diameter, π shall be taken to be 3,14159.

3.5.3 Determining the internal circumference (if agreed)

The internal circumference shall either be determined by measuring the external circumference as described in subclause 3.5.2 and deducting the mean wall thickness (i.e. the arithmetical mean of at least three measurements taken along the line used when measuring the circumference). Where d_a exceeds 500 mm, the wall thickness shall be measured at intervals of 500 mm or determined by using a gauged measuring tape.

3.6 Flattening

In the zone of radius r_1 , flattening of the curvature shall be permitted in lengths of maximum 15 % of r_1 .

3.7 Permissible deflection of flange

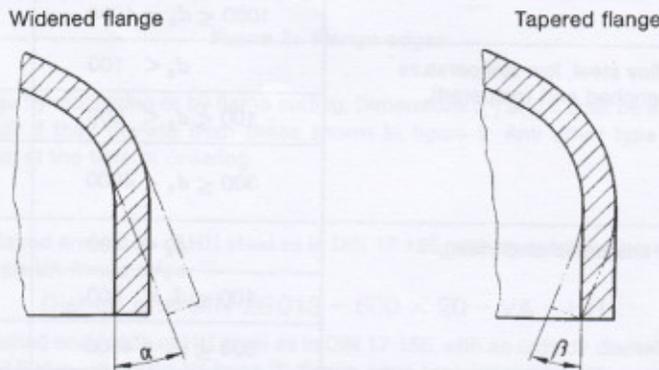

Figure 3: Angles of deflection

See table 4 for the permissible angles of deflection, α and β .

Table 4

d_a	α	β
< 1000	$\leq 4^\circ$	$\leq 2^\circ$
≥ 1000	$\leq 5^\circ$	

In arbitration cases, the measurements shall be taken on the inside.

3.8 Certificates

Any necessary certificates shall be agreed at the time of ordering (e.g. in accordance with the *Technische Regeln Druckbehälter* or *Technische Regeln Dampfkessel*).

- F 16 J 12/00
- F 22 B 37/22

Figure 1: Torospherical end

The internal and surface area of ends (depending on R_1) shall satisfy the following conditions:

Volume of dished part, $V = 0,129 R_1^3 - 2 R_1^2 t$

Internal surface area of dished part, $A_1 = 1,024 R_1^2$

Internal surface area of dished part, $A_2 = 1,024 R_1^2 - 2 R_1 t$

The dished end is defined by the height, R_1 , as specified in table 1. When ordering, it may be agreed that this end be marked on the dished end.

For t , see page 11.

● Series 1 pipe, outside diameter as in DIN 2448.

1) The flange height shall not be less than 3 s. It need not, however, exceed the following dimensions.

Wall thickness	Flange height
$s \leq 50$	150
$50 < s \leq 80$	120
$80 < s \leq 100$	100
$100 < s \leq 120$	75
$120 < s \leq$	50

Any other flange heights shall be subject to agreement.

2) See subclause 3.4.5.

3) For d_a greater than 4000 mm, the other dimensions, volume and surface area shall be calculated in line with clauses 1 and 2.

For 4), see page 3.
